

Monthly Report of Prospects for Japan's Economy

March 2009

Macro Economic Research Centre
Economics Department

The Japan Research Institute, Limited

<http://www.jri.co.jp/thinktank/research/>

This report is the English version of the February 2009 issue of the original Japanese version.

Current situation of Japan's economy – Deteriorating rapidly, mainly in the corporate sector

Japan's economy has recently been deteriorating very rapidly. In the corporate sector, a sharp declining trend of exports has been obvious in all regions as exports to emerging and resource-rich countries have been decreasing, in addition to a further decline in shipments to the US and European countries. Machinery orders excluding electric power and shipbuilding have also been dropping significantly since August 2008. Reflecting these unfavourable moves, industrial production both in the final quarter last year and in the first quarter this year is estimated to see a record rate of decrease. The household sector also continues to be in a sluggish situation. Private consumption is on a stagnating trend as employment and income environments have been worsening fast. The diffusion index for current conditions in the Economy Watchers Survey by the Cabinet Office also continues to stay in considerably negative territory.

It is, therefore, probable that the real GDP growth rate in the January-March period could be the second consecutive double-digit minus figure on a seasonally adjusted annualised quarter-on-quarter change basis.

Figure 1 Main Indicators for Japan's Economy

Source: The Ministry of Economy, Trade and Industry, The Ministry of Internal Affairs and Communications, The Cabinet Office, The Ministry of Land, Infrastructure and Transport, The Bank of Japan.

Note 1: Indices of industrial production and industrial inventory ratio are seasonally adjusted on a monthly basis. Others are calculated as seasonally adjusted and 3-month moving averages.

2: The industrial production index in January and February 2009 is based on METI forecasts. 3: Shaded areas indicate periods of recession according to the Cabinet Office.

Production in manufacturing – Has been declining very sharply; further downside risk remains

The industrial production index declined by a record 9.6 per cent last December over the previous month, mainly due to a sharp decrease in exports. Further, the production forecast indices for this January and February indicated a month-on-month drop of 9.1 per cent and 4.7 per cent, respectively. This forecast appears to predict that the trend of considerable decline could not be checked for the time being. Taking these forecast indices into consideration, industrial production in February is estimated to be at an around 40 per cent lower level than that of the month a year earlier, which is almost the same level as in the year 1983. The fall in the motor vehicle industry is especially significant. The forecast production level of motor vehicles in February is 60 per cent less than that in the month a year earlier.

Moreover, the amendment ratio in the forecast indices tends to be widening downwards and the trend has been intensifying recently. Therefore, it is probable that actual manufacturing production could be revised downwards further from the forecast.

Falling stock prices - Materialising negative effects on households and enterprises

The fall in stock prices has been accelerating since the latter half of September last year. The ratio of the total market value of the Tokyo Stock Exchange to nominal Gross Domestic Income (GDI) has declined to the lowest level in the past twenty years. It is expected that stock prices will continue to soften for the time being, due to an economic downturn at home and abroad and continued uncertainties surrounding the financial markets. The falling stock prices are likely to have adverse effects on the economy through the following three routes:

- (i) Sentiment. Deteriorating household and business sentiment, due to intensifying uncertainties as to future economic activity.
- (ii) Households. Intensified negative wealth effect on private consumption expenditure, especially in the households in higher income brackets and/or those with elderly persons as their household heads, which hold relatively large amounts of stock.
- (iii) Enterprises. Worsened corporate profits, reflecting appraisal losses due to the fall of the prices of the stocks held. The deteriorating corporate profits could weigh heavily on business fixed investment and compensation of employees.

The Yen appreciation - To cause exchange net losses by currency and weigh on real net exports

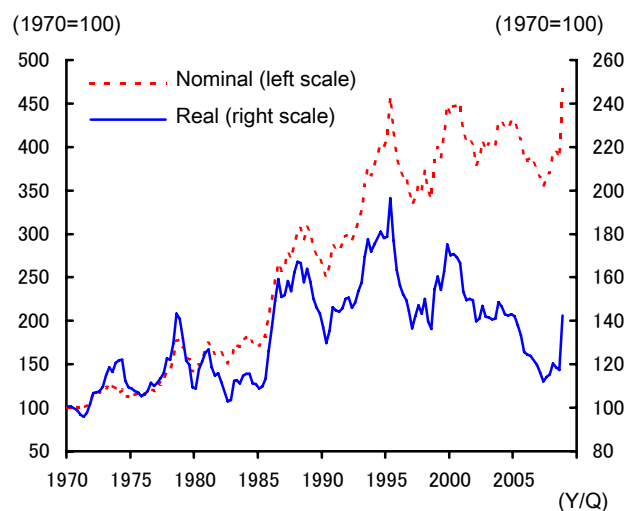

The Japanese yen has appreciated considerably since last summer against other currencies. During that period, it has risen against virtually all major trading currencies. As a result, the real effective rate of the yen has appreciated rapidly. As for the prospects, while the across-the-board appreciation of the yen would be settling for the time being, the yen is expected to continue a mild appreciation phase against the US dollar. Accordingly, the real effective rate of the yen would be at an around 20 % higher level than that of last summer.

The yen appreciation could have adverse influences on the economy through the following two routes:

(i) Export and import prices. The estimates of exchange losses and gains show that while the trade denominated in US dollars would bring about exchange gains, the trade denominated in other currencies would cause exchange losses, which would lead to reduced net gains or net losses in total currencies. This could erode corporate profits in the second half of FY2008 to March this year.

(ii) Export and import volume. A decrease in export volume and an increase in import volume could weigh on domestic production. The estimate shows that there would be an around one year time lag between the start of the yen appreciation and the time of the materialising of its negative influences on the economy. Therefore, the negative influences through this route could intensify from the middle of this year onwards.

The Japan Research Institute, Limited

Exports - A declining trend could be prolonged

It is expected that a declining trend of exports will be more noticeable, against the background of a further deterioration of overseas economies. Viewed by region:

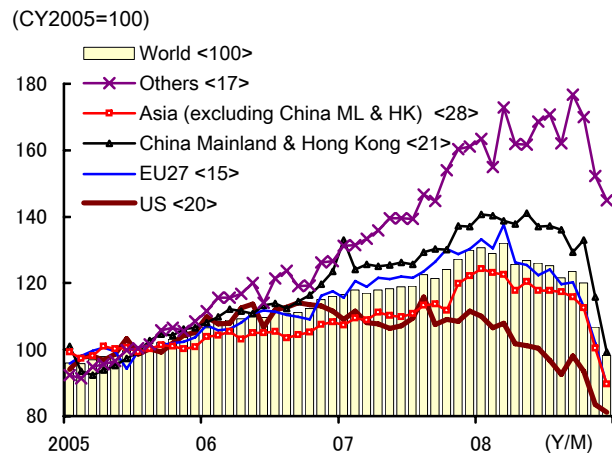

(i) To the US and European countries. A continued decline, reflecting the considerable downturn of their economic activity. Viewed by industry, in addition to a continued decline in exports of motor vehicles, shipments of industrial machinery could also be falling.

(ii) To resource-rich countries. A significant fall mainly in exports to Middle Eastern countries and Russia. The national income of resource-rich countries has been decreasing considerably due to the fall of resource prices.

(iii) To China. A declining trend had become obvious, mainly in exports of producer goods and capital goods. This is reflecting the deteriorating economic situation in the US and European countries.

Moreover, it is expected that negative influences of the yen appreciation would be materialising during this year. As a result, it is likely that the sluggish situation of Japan's exports could be prolonged. A declining trend is projected to continue at least until the end of FY2009.

Monthly Report of Prospects for Japan's Economy March 2009

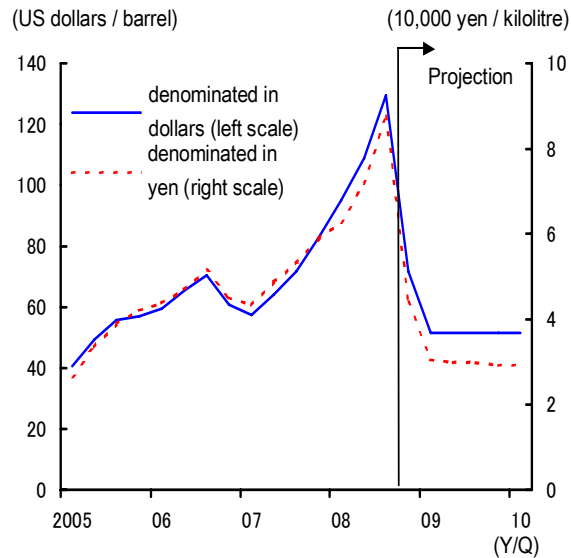

The Japan Research Institute, Limited

The impact of decline of resource prices - Increased income inflow from overseas

It is expected that resource prices would stay at a low level for the time being, as the world economy will decelerate considerably. Accordingly, the income shift from Japan to resource-rich countries peaked in the July-September period last year. As import prices have been falling sharply, the income inflow from overseas to Japan is projected to increase rapidly from the last October-December period onwards. The total amount of income inflow is estimated to be ten trillion yen during CY2009 to December 2009 or eight trillion yen during FY2009 to March 2010.

As a result, it is projected that the growth rate of real GDI (Gross Domestic Income), which includes an income increase or decrease due to the change of terms of trade (trade gains and losses), will exceed that of real GDP. Also, a decreasing trend of the surplus in goods and services in the balance of payments is expected to be checked.

2: Plus figures indicate income outflow to overseas, and minus figures indicate income inflow from overseas.

Figure 6-3 Real GDP and Real GDI
<year-on-year % change>

Source: The Japan Research Institute, Ltd. based on the data of The Cabinet Office.

The rate of increase in the CPI - To turn negative again; looming deflationary pressure

It is expected that moves to lower prices will spread among goods and services covered by the Consumer Price Index (CPI), due to re-emerging price competition and a fall of resource prices, amid the sluggish situation of private consumption expenditure. The core CPI (the CPI excluding fresh food) will decelerate rapidly in the second half of FY2008 mainly due to the sharp fall in the price of petrol, although food prices would stay at a high level. Then, the index is projected to turn negative and decline further sharply after the start of FY2009, against the background of a widening of the supply-demand gap, exhibiting looming deflationary pressure.

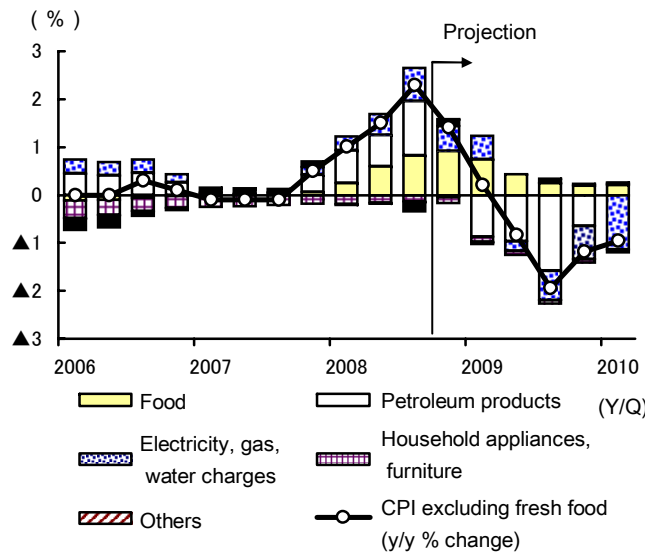

As for an improvement in income flow, at first, the increased income inflow from overseas to Japan due to the fall in resource prices would be a contribution to corporate profits rather than to a fall in consumer prices. Then, it would be a financially contributing factor to households after the start of FY2009. Almost all of the increased income inflow is projected to be the funds to compensate for a reduction in sales prices during the second half of FY2009.

Monthly Report of Prospects for Japan's Economy March 2009
The Japan Research Institute, Limited

Continued considerable decline of corporate profits and business fixed investment

It is projected that corporate profits would continue to see a double-digit fall in their change rate on a year earlier. Although an improvement in the output / input price ratio due to the fall in resource prices is expected to contribute to bolstering profits, downward pressure on profits from a decline in sales amount could intensify and outpace the improvement.

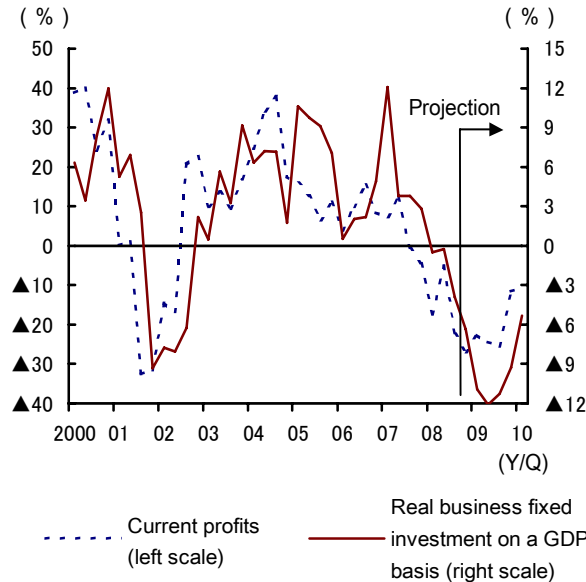

The year-on-year minus in the change in business fixed investment is estimated to expand at the moment due to the following: (i) the negative influences of high resource prices would still remain because of a time lag. (ii) The attitude of enterprises to business fixed investment will be more cautious, reflecting a lowering of capacity utilisation and a worsening of business sentiment. Especially, it is likely that investment in manufacturing would decline considerably. This forecast is predicted by the move that machinery orders in manufacturing have recently been dropping very sharply.

Declining exports, the yen appreciation - To weigh on the processing industries

An estimate of the influences of declining exports, the yen appreciation and the fall of the price of crude oil shows visibly the difference of the degree of impact between industries.

The processing industries, which feel a significant influence of a fall in exports and the yen appreciation, are estimated to be most adversely affected. Among nonmanufacturing, the wholesale trade and financial services industries, which have a high degree of export or overseas dependence, are estimated to have a downswing in their profits.

On the other hand, the material industries in manufacturing and nonmanufacturing other than the above mentioned industries are projected to have a positive net influence. This is because these industries are able to enjoy to an appreciable degree the benefits of exchange gains in imports and the fall in the price of crude oil.

Figure 9 The Estimated Impact of Declining Exports, the Yen Appreciation and the Fall of the Price of Crude Oil (during CY2009)

(% points)

		Impact of each factor on ratio of profits to sales			
			Decrease in exports	Appreciation of the yen	Fall in the price of crude oil
Manufacturing	Food	3.2	- 0.3	2.4	1.1
	Textiles	12.9	- 1.7	13.0	1.6

	Financial services and insurance	- 4.1	- 4.5	0.1	0.3
	Transport	- 3.9	- 6.1	- 0.5	2.7
	Communication and broadcasting	- 2.4	- 2.9	0.0	0.5
	Public service	- 2.1	- 3.2	0.4	0.7

Source: The Japan Research Institute, Ltd. based on the data of The Ministry of Internal Affairs and Communications, The Ministry of Finance, The Ministry of Economy, Trade and Industry, The Bank of Japan.

Note : The estimate is based on the assumptions that (i) the yen would appreciate by 20% against all other currencies, (ii) the price of crude oil would fall by 55%, and (iii) enterprises would pass on 30% of the increased costs to the sales prices.

Private consumption - Income to decrease, yet lifted by a fall in prices

In the household sector, the following three negative influences would be felt: (i) a worsened employment environment, (ii) a fall in wages, especially bonuses, and (iii) a negative wealth effect due to the fall in stock prices. On the other hand, there would be the following positive factors: (i) an expected two trillion yen of flat-sum cash benefits to households and (ii) an improvement in real purchasing power of households because of the fall in consumer prices.

Taking these into consideration, the projection for private consumption expenditure during FY2009 indicates a contraction in nominal private consumption for the first time in six years. In the income situation, disposable income in the period is expected to decrease slightly, because flat-sum cash benefits would make up partly for the decrease in income due to an economic downturn. In the expenditure side, the propensity to consume is expected to decline because of worsened sentiment for consumption and a negative wealth effect. However, real private consumption is projected to grow slightly in FY2009 to play a bolstering role for the economy. This is because the real purchasing power of households will advance, reflecting an improvement in the private consumption deflator due to the fall of consumer prices.

Monthly Report of Prospects for Japan's Economy March 2009

The Japan Research Institute, Limited

Prospects for Japan's economy - Projected real GDP change; -3.5% in FY2008 and -6.0% in FY2009

(1) It is expected that the recessionary phase of Japan's economy will be prolonged, against the background of a further deterioration in the economic activity in the US and European countries, and protracted turmoil in the financial markets. It is, especially, projected that Japan's real GDP during the second half of FY2008 to March 2009 will see a serious recessionary phase, which is two consecutive quarters of double-digit contraction, on a seasonally adjusted and annualised quarter-on-quarter change basis. Further, it is expected that the economy will follow a quarterly trajectory at a pace considerably below its potential output growth rate during FY2009. This will lead to minus 3.5 per cent in the real GDP change rate in FY2008 and minus 6.0 per cent in FY2009, a significant shrinking for two consecutive fiscal years.

(2) A main cause of the recession appears to be the rapid economic deterioration in the corporate sector. It is expected that Japan's exports, which had been a driving force for the economy, will continue to be declining, and there is not much prospect that the declining trend will be checked. This is due to the prolonged sluggish situation of the US and European economies exacerbated by uncertainties in the financial markets, diminishing driving power for Japan's economy of exports to emerging and resource-rich countries, and a gradual materialising of the negative effect of the Japanese yen appreciation. Reflecting a rapid decline in capacity utilisation, a decreasing trend in business fixed investment would be more visible, especially in the export industries such as motor vehicles and electronic parts and devices. An inventory adjustment could also lower the economic growth rate.

(3) In the household sector, it is expected that private consumption expenditure will continue a "low-flying" trend, due to stagnant income environments in addition to a negative wealth effect of falling stock prices. However, real private consumption expenditure is projected to grow slightly on a quarterly basis. This is because real purchasing power of households will advance reflecting an improvement in the private consumption deflator due to the fall of consumer prices

(4) As for income flow, the income shift from Japan to resource-rich countries peaked in the July-September period last year. As import prices have been falling sharply, the income inflow from overseas to Japan is projected to increase rapidly from the last October-December period onwards. The year-on-year per cent change in the GDP deflator will likely turn positive in FY2009, mainly reflecting a fall in the import deflator.
